

Symplectic Geometry

Radim Čech

February 2, 2025

Symplectic geometry is a branch of differential geometry that studies symplectic manifolds, which are smooth manifolds equipped with a closed, non-degenerate 2-form called a symplectic form. It originated from classical mechanics.

Definition 1 (Symplectic manifold). Let M be a smooth manifold of even dimension $2m$ and let $\omega \in \Omega^2(M)$ be a closed non degenerate 2-form i.e.

$$d\omega = 0 \text{ and } \omega^m = \omega \wedge \omega \wedge \cdots \wedge \omega \neq 0,$$

Then ω is called a *symplectic form* and the pair (M, ω) is called a *symplectic manifold*.

ekvivalentni definice nedegenerovanosti.

Narozdil od riemannovske geometrie nelze pouzit partitions of unity na konstrukci metriky.

napsat poznamku o koncenci se psanim dimenze manifoldu :D

Example 2 (Canonical symplectic structure). Let $M = \mathbb{R}^{2m}$ with the global coordinates $q_1, \dots, q_m, p_1, \dots, p_m$. and let ω be a form s.t.,

$$\omega = \sum_{i=1}^m dp_i \wedge dq_i.$$

Then

$$\omega^m = m! \cdot (-1)^{m(m-1)/2} \cdot dp_1 \wedge \cdots \wedge dp_m \wedge dq_1 \wedge \cdots \wedge dq_m.$$

We call \mathbb{R}^{2m} with the form ω the canonical symplectic structure.

Example 3 (Cotangent bundle is a symplectic manifold.). Let Q be a manifold, and consider the manifold $M = T^*Q$. Then there is a canonical 1-form $\theta \in \Omega^1(M)$ given by

$$\theta(X) = \langle \pi_{T^*Q}(X), T(\pi_Q)(X) \rangle, \quad X \in T(T^*Q), \quad (1)$$

where $\langle \cdot, \cdot \rangle$ is the natural pairing between tangent and cotangent spaces and the projections are the following:

Let $q = (q^1, \dots, q^n) : U \rightarrow \mathbb{R}^n$ be a chart on Q , then we have the induced chart $T^*q : T^*U \rightarrow \mathbb{R}^n \times \mathbb{R}^n$, where $T_x^*q = (T_x q^{-1})^*$, we put $p_i := \langle e_i, T^*q(\cdot) \rangle : T^*U \rightarrow \mathbb{R}$. Then $(q^1, \dots, q^n, p_1, \dots, p_n) : T^*U \rightarrow \mathbb{R}^n \times (\mathbb{R}^n)^*$ are the induced coordinates and locally in these coordinates

$$\theta(q, p) = \sum_{i=1}^n \left(\theta \left(\frac{\partial}{\partial q^i} \right) dq^i + \theta \left(\frac{\partial}{\partial p_i} \right) dp_i \right) = \sum_{i=1}^n p_i dq^i + 0, \quad (2)$$

since $\theta \left(\frac{\partial}{\partial q^i} \right) = \theta_{\mathbb{R}^n}((q, p; e_i, 0)) = \langle p, e_i \rangle = p_i$.

Now we define the 2-form $\omega \in \Omega^2(T^*Q)$ by

$$\omega := -d\theta \stackrel{\text{locally}}{=} \sum_{i=1}^n dq^i \wedge dp_i. \quad (3)$$

We see that the 2-form ω is non-degenerate.

Definition 4. The form $\theta \in \Omega^1(M)$ from (1), locally given by (2), is called the *tautological 1-form* on T^*Q . The induced 2-form ω from (3) is called the *canonical symplectic structure* on T^*Q .

dukaz ze je neni degen?

Definition 5. Let $X : J \times M \rightarrow TM$ be a smooth mapping such that $\pi_M \circ X = pr_2$, where J is open. Then we call X a *time dependent vector field* on a manifold M .

There is an associated vector field $\bar{X} \in \mathfrak{X}(J \times M)$, given by $\bar{X}(t, x) = (\frac{\partial}{\partial t}, X(t, x)) \in T_t\mathbb{R} \times T_xM$.

Definition 6. Let X be a time dependent vector field on a manifold M and let $\Phi^X : J \times J \times M \rightarrow M$ be a map defined on a maximal neighborhood of $\Delta_J \times M$ satisfying the differential equation

$$\begin{aligned} \frac{d}{dt} \Phi^X(t, s, x) &= X(t, \Phi^X(t, s, x)) \\ \Phi^X(s, s, x) &= x \end{aligned} \quad (4)$$

Definition 6 is equivalent with

$$(t, \Phi^X(t, s, x)) = Fl^{\bar{X}}(t - s, (s, x)),$$

so the evolution operator exists and is unique on a maximal integral curve and satisfies

$$\Phi_{t,s}^X = \Phi_{t,r}^X \circ \Phi_{r,s}^X, \text{ where } \Phi_{t,r}^X(x) = \Phi(t, s, x).$$

Lemma 7. Let f_t be a curve of diffeomorphisms on a manifold M locally defined for each t such that $f_0 = Id$. Defined two time dependent vector fields

$$\xi_t(x) := (T_x f_t)^{-1} \frac{\partial}{\partial t} f_t(x), \quad \eta_t(x) := \left(\frac{\partial}{\partial t} f_t \right) (f_t^{-1}(x)) \quad (5)$$

Then $T(f_t) \cdot \xi_t = \frac{\partial}{\partial t} f_t = \eta_t \circ f_t$, so ξ_t and η_t are f_t -related. Let $\omega \in \Omega^k(M)$. Then

$$i_{\xi_t} f_t^* \omega = f_t^* i_{\eta_t} \omega, \quad (6)$$

$$\frac{\partial}{\partial t} f_t^* \omega = f_t^* \mathcal{L}_{\eta_t} \omega = \mathcal{L}_{\xi_t} f_t^* \omega. \quad (7)$$

Proof.

$$\begin{aligned} (i_{\xi_t} f_t^* \omega)_x(X_2, \dots, X_k) &= (f_t^* \omega)_x(\xi_t(x), X_2, \dots, X_k) \\ &= \omega_{f_t(x)}(T_x f_t \cdot \xi_t(x), T_x f_t \cdot X_2, \dots, T_x f_t \cdot X_k) \\ &= \omega_{f_t(x)}(\eta_t(f_t(x)), T_x f_t \cdot X_2, \dots, T_x f_t \cdot X_k) \\ &= (f_t^* i_{\eta_t} \omega)_x(X_2, \dots, X_k) \end{aligned}$$

This proves (6). Now consider $\bar{\eta} \in \mathfrak{X}(\mathbb{R} \times M)$, $\bar{\eta}(t, x) = (\partial_t, \eta_t(x))$ and let $\Phi^\eta : \mathbb{R} \times \mathbb{R} \times M \rightarrow M$ be the evolution operator, i.e.

$$\frac{\partial}{\partial t} \Phi_{t,s}^\eta(x) = \eta_t(\Phi_{t,s}^\eta(x)), \quad \Phi_{s,s}^\eta(x) = x,$$

such that

$$(t, \Phi_{t,s}^\eta(x)) = Fl_{t-s}^{\bar{\eta}}(s, x), \quad \Phi_{t,s}^\eta = \Phi_{t,r}^\eta \circ \Phi_{r,s}^\eta(x).$$

Since f_t satisfies $\frac{\partial}{\partial t} f_t = \eta_t \circ f_t$ and $f_0 = Id_M$, either $f_t = \Phi_{t,0}^\eta$, or $(t, f_t(x)) = Fl_t^\eta(0, x)$, so $f_t = pr_2 \circ Fl_t^\eta \circ ins_0$. Thus

$$\frac{\partial}{\partial t} f_t^* \omega = \frac{\partial}{\partial t} (pr_2 \circ Fl_t^\eta \circ ins_0)^* \omega = ins_0^* \frac{\partial}{\partial t} (Fl_t^\eta)^* pr_2^* \omega = ins_0^* (Fl_t^\eta)^* \mathbb{L}_{\bar{\eta}} pr_2^* \omega.$$

For time dependant vector fields X_i (tady mozna nejaka vlastnost lie derivative!!!) we have

$$\begin{aligned} (\mathcal{L}_{\bar{\eta}} pr_2^* \omega)(0 \times X_1, \dots, 0 \times X_k)|_{(t,x)} &= \bar{\eta}((pr_2^* \omega)(0 \times X_1, \dots))|_{(t,x)} \\ &\quad - \sum_i (pr_2^* \omega)(0 \times X_1, \dots, [\bar{\eta}, 0 \times X_i], \dots, 0 \times X_k)|_{(t,x)} \\ &= (\partial_t, \eta_t(x))(\omega(X_1, \dots, X_k)) - \sum_i \omega(X_1, \dots, [\eta_t, X_i], \dots, X_k)|_x \\ &= (\mathcal{L}_{\eta_t} \omega)_x(X_1, \dots, X_k). \end{aligned}$$

For $X_i \in T_x M$, this implies

$$\begin{aligned} \left(\frac{\partial}{\partial t} f_t^* \omega \right)_x(X_1, \dots, X_k) &= \left(ins^*(Fl_t^\eta)^* \mathcal{L}_{\eta} pr_2^* \omega \right)_x(X_1, \dots, X_k) \\ &= ((Fl_t^\eta)^* \mathcal{L}_{\eta} pr_2^* \omega)_{(0,x)}(0 \times X_1, \dots, 0 \times X_k) \\ &= (\mathcal{L}_{\eta} pr_2^* \omega)_{(t, f_t(x))}(0_t \times T_x f_t \cdot X_1, \dots, 0_t \times T_x f_t \cdot X_k) \\ &= (\mathcal{L}_{\eta_t} \omega)_{f_t(x)}(T_x f_t \cdot X_1, \dots, T_x f_t \cdot X_k) \\ &= (f_t^* \mathcal{L}_{\eta_t} \omega)_x(X_1, \dots, X_k), \end{aligned} \tag{8}$$

We have proven the first part of (7), the second part follow from (6)

$$\begin{aligned} \frac{\partial}{\partial t} f_t^* \omega &= f_t^* \mathcal{L}_{\eta_t} \omega \\ &= f_t^* (di_{\eta_t} + i_{\eta_t} d) \omega \\ &= df_t^* i_{\eta_t} \omega + f_t^* i_{\eta_t} d\omega \\ &= di_{\xi_t} f_t^* \omega + i_{\xi_t} f_t^* d\omega \\ &= di_{\xi_t} f_t^* \omega + i_{\xi_t} df_t^* \omega \\ &= \mathcal{L}_{\xi_t} f_t^* \omega. \end{aligned} \tag{9}$$

□

dopsat co je ins a pr2?

Theorem 8 (Darboux). *Let (M, ω) be a symplectic manifold of dimension $2n$. Then for all points $x \in M$ exists a chart (U, u) centered at x such that $\omega|_U = \sum_{i=1}^n du^i \wedge du^{n+i}$.*

Proof. Take a chart (U, u) centered at x and choose coordinates such that $\omega_x = \sum_{i=1}^n du^i \wedge du^{n+i}$ at x . Then $\omega_0 = \omega|_U$ and $\omega_1 = \sum_{i=1}^n du^i \wedge du^{n+i}$ are two symplectic forms that are equal at x . Now interpolate $\omega_t = \omega_0 + t(\omega_1 - \omega_0)$. Then ω_t is a symplectic form on a possibly smaller neighbourhood of x for all $t \in [0, 1]$.

We want to find a curve of diffeomorphisms f_t near x such that $f_0 = id$, $f_t(x) = x$ and such that the pullback condition $f_t^* \omega_t = \omega_0$ is satisfied. Assume that U is contractible, then the second cohomology group $H^2(U) = 0$ and every closed 2-form is exact, so $d(\omega_1 - \omega_0) = 0$ implies $\omega_1 - \omega_0 = d\psi$ for some $\psi \in \Omega^1(U)$. By adding a constant we may assume that $\psi_x = 0$. Now by using Lemma 7, (7), we get a time dependant vector field $\eta_t = \frac{\partial}{\partial t} f_t \circ f_t^{-1}$, then by differentiating with respect to t , (cartan formula!!)

$$0 = \frac{\partial}{\partial t} f_t^* \omega_t = f_t^* \left(\mathcal{L}_{\eta_t} \omega_t + \frac{\partial}{\partial t} \omega_t \right) = f_t^* (di_{\eta_t} \omega_t + i_{\eta_t} d\omega_t + \omega_1 - \omega_0) = f_t^* d(i_{\eta_t} \omega_t + \psi)$$

Since ω_t is non-degenerate, the equation $i_{\eta_t} \omega_t = -\psi$ prescribes the vector field η_t uniquely. Also $\eta_t(x) = 0$ sine $\psi_x = 0$. On some neighbourhood of x the left evolution operator f_t of η_t exists for all $t \in [0, 1]$ and $\frac{\partial}{\partial t} (f_t^* \omega_t) = 0$, so $f_t^* \omega_t = \omega_0$ for all $t \in [0, 1]$. □

NOW lets study symplectomorphisms.
mozna dopsat definici lagrangian manifold

Definition 9 (Lagrangian submanifold). Let (M^{2m}, ω) be a symplectic manifold. We call a submanifold Y of M lagrangian, if at each $p \in Y$, $T_p Y$ is a lagrangian subspace of $T_p M$, that is, $\omega_p|_{T_p Y} \equiv 0$ and $\dim T_p Y = \frac{1}{2} \dim T_p M$.

Equivalently, if $i : Y \rightarrow M$ is the inclusion map, then Y is lagrangian if and only if $i^* \omega = 0$ and $\dim Y = \frac{1}{2} \dim M$

Example 10 (The zero section of T^*M). Let M^m be a manifold and consider its cotangent bundle T^*M with the local coordinates $x_1, \dots, x_m, \xi_1, \dots, \xi_m$ on T^*U . Then the *zero section* of T^*M is the set

$$M_0 = (x, \xi) \in T^*M | \xi = 0 \text{ in } T_x^*M$$

is an m -dimensional submanifold of T^*M whose intersection with T^*U is given by the equations $\xi_1 = \dots = \xi_m = 0$. Then clearly the tautological 1-form $\theta(x, \xi)$ vanishes on $M_0 \cap T^*U$. Let $i_0 : M_0 \rightarrow T^*M$ be the inclusion map, then $i_0^* \theta = 0$. Hence $i_0^* \omega = i_0^* d\theta = 0$ and so M_0 is lagrangian.

Now let $\mu \in \Omega^1(M)$ be a 1-form and consider the set

$$M_\mu = \{(x, \mu_x) \mid x \in X, \mu_x \in T_x^*X\} \quad (10)$$

Then M_μ is a submanifold of T^*M . When is M_μ lagrangian?

Lemma 11. *Let M_μ be of the form (10). Denote by $s_\mu : M \rightarrow T^*M, x \rightarrow (x, \mu_x)$ the 1-form μ regarded as a map. Let θ be the tautological 1-form on T^*M . Then*

$$s_\mu^* \theta = \mu$$

Proof. By definition of θ , $\theta_p = (d\pi)^* \xi$ at $p = (x, \xi) \in M$. For $p = s_\mu(x) = (x, \mu_x)$, we have $\theta_p = (d\pi_p)^* \mu_x$. Then

$$(s_\mu^* \theta)_x = (ds_\mu)_x^* \theta_p = (ds_\mu)_x^* (d\pi_p)^* \mu_x = (d(\pi \circ s_\mu))_x^* \mu_x = \mu_x.$$

□

Lemma 12. *Let M_μ be of the form (10). Then M_μ is lagrangian iff. μ is closed.*

Proof. The map $s_\mu : M \rightarrow T^*M, x \rightarrow (x, \mu_x)$ is an embedding with image M_μ . Then there is a diffeomorphism $\tau : M \rightarrow M_\mu, \tau(x) := (x, \mu_x)$, such that the following diagram commutes:

$$\begin{array}{ccc} X & \xrightarrow{s_\mu} & T^*X \\ & \searrow \tau & \uparrow i \\ & & X_\mu \end{array}$$

We want to express the condition of M_μ being Lagrangian in terms of the form μ :

$$\begin{aligned} M_\mu \text{ is Lagrangian} &\iff i^* d\theta = 0 \\ &\iff \tau^* i^* d\theta = 0 \\ &\iff (i \circ \tau)^* d\theta = 0 \\ &\iff s_\mu^* d\theta = 0 \\ &\iff ds_\mu^* \theta = 0 \\ &\iff d\mu = 0 \\ &\iff \mu \text{ is closed.} \end{aligned} \quad (11)$$

Therefore, there is a one-to-one correspondence between the set of Lagrangian submanifolds of T^*M of the form (10) and the set of closed 1-forms on M . □

There are other lagrangian submanifolds of T^*M . Lets study the conormal bundles.

Definition 13. Let S^k be submanifold of M^m , then the *conormal space* at x is the set

$$N_x^*S = \{\xi \in T_x^*M \mid \xi(v) = 0, v \in T_xM\}.$$

The *conormal bundle* of S is

$$N^*S = \{(x, \xi) \in T^*M \mid x \in S, \xi \in N_x^*S\}.$$

Example 14. Let $S \subset X$ be a submanifold, then the conormal bundle N^*S is a lagrangian submanifold of T^*x .

Lemma 15. The conormal bundle N^*S is an n -dimensional submanifold of T^*M .

Lemma 16. Let $i : N^*S \hookrightarrow T^*M$ be the inclusion and θ the tautological 1-form on T^*M . Then

$$i^*\theta = 0.$$

Proof. Let (U, x_1, \dots, x_n) be a coordinate system on M centered at $x \in S$ and adapted to M , so that $U \cap S$ is described by

$$x_{k+1} = \dots = x_n = 0. \text{ and } \xi_1 = \dots = \xi_k = 0$$

Let $(U, x_1, \dots, x_n, \xi_1, \dots, \xi_n)$ be the associated cotangent coordinate system. The submanifold $N^*S \cap T^*U$ is then described by

$$x_{k+1} = \dots = x_n = 0 \text{ and } \xi_1 = \dots = \xi_k = 0. \quad (12)$$

Since $\theta = \sum \xi_i dx_i$ on T^*U , we conclude that, at $p \in N^*S$,

$$(i^*\theta)_p = \theta_p|_{T_p(N^*S)} = \sum_{i>k} \xi_i dx_i \Big|_{\text{span}\left\{\frac{\partial}{\partial x_i}, i \leq k\right\}} = 0. \quad (13)$$

□

Corollary 17. For any submanifold S of M , the conormal bundle N^*S is a lagrangian submanifold of T^*M .

Notice that taking $S = \{x\}$ to be a point, then the conormal bundle $N^*S = T_x^*M$ is a cotangent fiber. Taking $S = X$, the conormal bundle is the zero section M_0 .

Lets study the poisson bracket.

Definition 18 (Hamiltonian vector field). Let (M, ω) be a symplectic manifold and $f \in C^\infty(M)$. Then the *Hamiltonian vector field* or *symplectic gradient* of f $H_f = \text{grad}^\omega(f) \in \mathfrak{X}(M)$ is defined by the following equivalent prescriptions:

$$\begin{aligned} i(H_f)\omega &= df, \\ H_f &= \omega^{-1}df, \\ \omega(H_f, X) &= X(f) \quad \text{for } X \in TM. \end{aligned}$$

Definition 19. For two functions $f, g \in C^\infty(M)$, we define their *Poisson bracket* $\{f, g\}$ by

$$\{f, g\} := i(H_f)i(H_g)\omega = \omega(H_g, H_f) = H_f(g) = \mathcal{L}_{H_f}g = dg(H_f) \in C^\infty(M). \quad (14)$$

Let us furthermore put

$$\mathfrak{X}(M, \omega) := \{X \in \mathfrak{X}(M) : \mathcal{L}_X\omega = 0\} \quad (15)$$

and call this the space of *locally Hamiltonian vector fields* or ω -*respecting vector fields*.

Theorem 20. Let (M, ω) be a symplectic manifold.

Then $(C^\infty(M), \{, \})$ is a Lie algebra which also satisfies

$$\{f, gh\} = \{f, g\}h + g\{f, h\},$$

i.e., $\text{ad}_f = \{f, \cdot\}$ is a derivation of $(C^\infty(M), \cdot)$.

Moreover, there is an exact sequence of Lie algebras and Lie algebra homomorphisms

$$0 \longrightarrow H^0(M) \xrightarrow{\alpha} C^\infty(M) \xrightarrow{H=\text{grad}^\omega} \mathfrak{X}(M, \omega) \xrightarrow{\gamma} H^1(M) \longrightarrow 0$$

where the brackets are written under the spaces, where α is the embedding of the space of all locally constant functions, and where

$$\gamma(X) := [i_X \omega] \in H^1(M).$$

The whole situation behaves invariantly (resp. equivariantly) under the pullback by symplectomorphisms $\varphi : M \rightarrow M$: For example

$$\varphi^*\{f, g\} = \{\varphi^*f, \varphi^*g\}, \quad \varphi^*(H_f) = H_{\varphi^*f}, \quad \text{and} \quad \varphi^*\gamma(X) = \gamma(\varphi^*X).$$

Consequently, for $X \in \mathfrak{X}(M, \omega)$ we have

$$\mathcal{L}_X\{f, g\} = \{\mathcal{L}_X f, g\} + \{f, \mathcal{L}_X g\}, \quad \text{and} \quad \gamma(\mathcal{L}_X Y) = 0.$$

Proof. The operator H takes values in $\mathfrak{X}(M, \omega)$ since

$$\mathcal{L}_{H_f} \omega = i_{H_f} d\omega + di_{H_f} \omega = 0 + ddf = 0.$$

$$H(\{f, g\}) = [H_f, H_g]$$

since by (7.9) and (7.7) we have

$$i_{H(\{f, g\})} \omega = d\{f, g\} = d\mathcal{L}_{H_f} g = \mathcal{L}_{H_f} dg - 0 = \mathcal{L}_{H_f} i_{H_g} \omega - i_{H_g} \mathcal{L}_{H_f} \omega = [\mathcal{L}_{H_f}, i_{H_g}] \omega = i_{[H_f, H_g]} \omega. \quad (16)$$

The sequence is exact at $H^0(M)$ since the embedding α of the locally constant functions is injective. The sequence is exact at $C^\infty(M)$: For a locally constant function c we have

$$H_c = \tilde{\omega}^{-1} dc = \tilde{\omega}^{-1} 0 = 0.$$

If $H_f = \tilde{\omega}^{-1} df = 0$ for $f \in C^\infty(M)$ then $df = 0$, so f is locally constant.

The sequence is exact at $\mathfrak{X}(M, \omega)$: For $X \in \mathfrak{X}(M, \omega)$ we have

$$di_X \omega = i_X d\omega + i_X d\omega = \mathcal{L}_X \omega = 0,$$

thus $\gamma(X) = [i_X \omega] \in H^1(M)$ is well-defined. For $f \in C^\infty(M)$ we have

$$\gamma(H_f) = [i_{H_f} \omega] = [df] = 0 \in H^1(M).$$

If $X \in \mathfrak{X}(M, \omega)$ with $\gamma(X) = [i_X \omega] = 0 \in H^1(M)$ then $i_X \omega = df$ for some $f \in \Omega^0(M) = C^\infty(M)$, but then $X = H_f$.

The sequence is exact at $H^1(M)$: The mapping γ is surjective since for $\varphi \in \Omega^1(M)$ with $d\varphi = 0$ we may consider

$$X := \tilde{\omega}^{-1} \varphi \in \mathfrak{X}(M)$$

which satisfies

$$\mathcal{L}_X \omega = i_X d\omega + di_X \omega = 0 + d\varphi = 0$$

and

$$\gamma(X) = [i_X \omega] = [\varphi] \in H^1(M).$$

The Poisson bracket $\{, \}$ is a Lie bracket and

$$\{f, gh\} = \{f, g\}h + g\{f, h\} :$$

$$\{f, g\} = \omega(H_g, H_f) = -\omega(H_f, H_g) = \{g, f\}, \quad (17)$$

$$\{f, \{g, h\}\} = \mathcal{L}_{H_f} \mathcal{L}_{H_g} h = [\mathcal{L}_{H_f}, \mathcal{L}_{H_g}] h + \mathcal{L}_{H_g} \mathcal{L}_{H_f} h \quad (18)$$

$$= [\mathcal{L}_{H_f}, \mathcal{L}_{H_g}] h + \{g, \{f, h\}\} = \mathcal{L}_{H_{\{f, g\}}} h + \{g, \{f, h\}\} \quad (19)$$

$$= \{\{f, g\}, h\} + \{g, \{f, h\}\}, \quad (20)$$

$$\{f, gh\} = \mathcal{L}_{H_f}(gh) = \mathcal{L}_{H_f}(g)h + g\mathcal{L}_{H_f}(h) = \{f, g\}h + g\{f, h\}. \quad (21)$$

All mappings in the sequence are Lie algebra homomorphisms: For local constants $\{c_1, c_2\}$ we have $H_{c_1 c_2} = 0$. For H we already checked. For $X, Y \in \mathfrak{X}(M, \omega)$ we have

$$i_{[X, Y]} \omega = [\mathcal{L}_X, i_Y] \omega = \mathcal{L}_X i_Y \omega - i_Y \mathcal{L}_X \omega = di_X i_Y \omega + i_X di_Y \omega - 0 = di_X i_Y \omega,$$

thus

$$\gamma([X, Y]) = [i_{[X, Y]} \omega] = 0 \in H^1(M).$$

Let us now transform the situation by a symplectomorphism $\varphi : M \rightarrow M$ via pullback. Then

$$\begin{aligned} \varphi^* \omega &= \omega \quad \Leftrightarrow \quad (T\varphi)^* \circ \tilde{\omega} \circ T\varphi = \tilde{\omega} \\ \Rightarrow H_{\varphi^* f} &= \tilde{\omega}^{-1} d(\varphi^* f) = \tilde{\omega}^{-1} (\varphi^* df) = (T\varphi^{-1} \circ \tilde{\omega}^{-1} \circ (T\varphi)^*)(df \circ \varphi) = \varphi^*(H_f) \\ \varphi^* \{f, g\} &= \varphi^*(dg(H_f)) = (\varphi^* dg)(\varphi^* H_f) = d(\varphi^* g)(H_{\varphi^* f}) = \{\varphi^* f, \varphi^* g\}. \end{aligned}$$

The operator $X \mapsto \mathcal{L}_X$ is the Lie derivative followed by applying

$$\mathcal{L}_X = \left. \frac{\partial}{\partial t} \right|_{t=0} (F_t^X)^*.$$

□
